Lloydminster Southwest Area Structure Plan

Map 5: Future Sanitary Sewer (Concept 1)

This map outlines the proposed sanitary sewer infrastructure. This system operates as a large underground plumbing system that transports wastewater from homes and businesses to the Lloydminster Wastewater Treatment Facility. There are two (2) concepts identified in the Sanitary Sewer Master Plan (2024) for the proposed infrastructure. Concept One (1) involves routing the peak wet weather flow (WWF) from the quarter section adjacent to Parkview Estates into the existing sanitary sewer collection system. This approach is ideal if development in this area progresses faster than in the parcels south of 12 Street, though it relies on the capacity of the current infrastructure, which is limited.
